# THE GAUSSIAN MEASURE ON ALGEBRAIC VARIETIES 

ILKA AGRICOLA AND THOMAS FRIEDRICH

#### Abstract

We prove that the ring $\mathbf{R}[M]$ of all polynomials defined on a real algebraic variety $M \subset \mathbf{R}^{n}$ is dense in the Hilbert space $L^{2}\left(M, e^{-|x|^{2}} \mathrm{~d} \mu\right)$, where $\mathrm{d} \mu$ denotes the volume form of $M$ and $\mathrm{d} \nu=e^{-|x|^{2}} \mathrm{~d} \mu$ the Gaussian measure on $M$.

## 1. Introduction

The aim of the present note is to prove that the ring $\mathbf{R}[M]$ of all polynomials defined on a real algebraic variety $M \subset \mathbf{R}^{n}$ is dense in the Hilbert space $L^{2}\left(M, e^{-|x|^{2}} \mathrm{~d} \mu\right)$, where $\mathrm{d} \mu$ denotes the volume form of $M$ and $\mathrm{d} \nu=e^{-|x|^{2}} \mathrm{~d} \mu$ is the Gaussian measure on $M$. In case $M=\mathbf{R}^{n}$, the result is well known since the Hermite polynomials constitute a complete orthonormal basis of $L^{2}\left(\mathbf{R}^{n}, e^{-|x|^{2}} \mathrm{~d} \mu\right)$.

## 2. The volume growth of an algebraic variety and some consequences

We consider a smooth algebraic variety $M \subset \mathbf{R}^{n}$ of dimension $d$. Then $M$ has polynomial volume growth: there exists a constant $C$ depending only on the degrees of the polynomials defining $M$ such that for any euclidian ball $B_{r}$ with center $0 \in \mathbf{R}^{n}$ and radius $r>0$ the inequality

$$
\operatorname{vol}_{d}\left(M \cap B_{r}\right) \leq C \cdot r^{d}
$$

holds (see [Brö]). Via Crofton formulas the mentioned inequality is a consequence of Milnor's results concerning the Betti numbers of an algebraic variety (see [Mi1], [Mi2], in which the stated inequality is already implicitly contained). This estimate yields first of all that the restrictions on $M$ of the polynomials on $\mathbf{R}^{n}$ are square-integrable with respect to the Gaussian measure on $M$.
Proposition 1. Let $M$ be a smooth submanifold of the euclidian space $\mathbf{R}^{n}$. Suppose that $M$ has polynomial volume growth,i.e., there exist constants $C$ and $l \in \mathbf{N}$ such that for any ball $B_{r}$

$$
\operatorname{vol}_{d}\left(M \cap B_{r}\right) \leq C \cdot r^{l}
$$

holds. Denote by $\mathrm{d} \mu$ the volume form of $M$. Then:

1. The ring $\mathbf{R}[M]$ of all polynomials on $M$ is contained in the Hilbert space $L^{2}\left(M, e^{-|x|^{2}} \mathrm{~d} \mu\right)$;
2. all functions $e^{\alpha|x|^{2}}$ for $\alpha<1 / 2$ belong to $L^{2}\left(M, e^{-|x|^{2}} \mathrm{~d} \mu\right)$.

Proof. Throughout this article, denote the distance of the point $x \in \mathbf{R}^{n}$ to the origin by $r^{2}=|x|^{2}$. We shall prove that the integrals

$$
I_{m}(M):=\int_{M} r^{m} e^{-r^{2}} \mathrm{~d} \mu<\infty, \quad m=1,2, \ldots
$$

are finite. However,

$$
I_{m}(M)=\sum_{j=0}^{\infty} \int_{M \cap\left(B_{j+1}-B_{j}\right)} r^{m} e^{-r^{2}} \mathrm{~d} \mu
$$

[^0]and consequently we can estimate $I_{m}(M)$ as follows:
$I_{m}(M) \leq \sum_{j=0}^{\infty}(j+1)^{m} e^{-j^{2}}\left[\operatorname{vol}\left(M \cap B_{j+1}\right)-\operatorname{vol}\left(M \cap B_{j}\right)\right] \leq \sum_{r=0}^{\infty}(r+1)^{m} e^{-r^{2}} \operatorname{vol}\left(M \cap B_{r+1}\right)$.
Using the assumption on the volume growth of $M$ we immediately obtain
$$
I_{m}(M) \leq C \cdot \sum_{r=0}^{\infty}(r+1)^{m+l} e^{-r^{2}}
$$

Denoting the summands of the latter series by $a_{r}$, we readily see that it converges, since

$$
\frac{a_{r+1}}{a_{r}}=\frac{(r+1)^{m+l} e^{-r^{2}-2 r-1}}{(r)^{m+l} e^{-r^{2}}}=\left(\frac{r+1}{r}\right)^{m+l} \frac{1}{e^{2 r+1}} \longrightarrow 0
$$

A similar calculation yields the result for the functions $e^{\alpha r^{2}}$ with $\alpha<1 / 2$.

## 3. A Dense subspace in $\mathcal{C}_{\infty}^{0}\left(S^{n}\right)$

The aim of this section is to verify that a certain linear subspace of $\mathcal{C}^{0}\left(S^{n}\right)$ is dense therein. Since the family of functions we have in mind cannot be made into an algebra, we have to replace the standard Stone-Weierstraß argument by something different. The idea for overcoming this problem is to use a combination of the well-known theorems of Hahn-Banach, Riesz and Bochner.

To begin with, we uniformly approximate the function $e^{-r^{2}} e^{i\langle k, x\rangle}$ for a fixed vector $k \in \mathbf{R}^{n}$.
Lemma. Denote by $p_{m}(x)$ the polynomial

$$
p_{m}(x)=\sum_{\alpha=0}^{m-1} i^{\alpha}\langle k, x\rangle^{\alpha} / \alpha!
$$

Then the sequence $e^{-r^{2}} p_{m}(x)$ converges uniformly to $e^{-r^{2}} e^{i\langle k, x\rangle}$ on $\mathbf{R}^{n}$.
Proof. The inequality

$$
\left|p_{m}(x)-e^{i\langle k, x\rangle}\right| \leq \frac{\|k\|^{m}\|x\|^{m}}{m!} e^{\|k\| \cdot\|x\|}
$$

implies $($ set $y=\|k\| \cdot\|x\|)$

$$
\sup _{x \in \mathbf{R}^{n}}\left|e^{-r^{2}} p_{m}(x)-e^{-r^{2}} e^{i\langle k, x\rangle}\right| \leq \sup _{0 \leq y} \frac{y^{m}}{m!} e^{y-y^{2} /\|k\|^{2}}=: C_{m}
$$

Therefore, we have to check that for any fixed vector $k \in \mathbf{R}^{n}$ the sequence $C_{m}$ tends to zero as $m \rightarrow \infty$. For simplicity, denote by $k$ the length of the vector $k \in \mathbf{R}^{n}$. A direct calculation yields the following formula:

$$
C_{m}=\frac{1}{m!}\left(\frac{k^{2}}{4}+\frac{k}{4} \sqrt{k^{2}+8 m}\right)^{m} \exp \left(\frac{k^{2}}{4}+\frac{k}{4} \sqrt{k^{2}+8 m}-\frac{1}{k^{2}}\left(\frac{k^{2}}{4}+\frac{k}{4} \sqrt{k^{2}+8 m}\right)^{2}\right)
$$

We are only interested in the asymptotics of $C_{m}$. We will thus ignore all constant factors not depending on $m$. In this sense, we obtain

$$
C_{m} \approx \frac{1}{m!}\left(\frac{k^{2}}{4}+\frac{k}{4} \sqrt{k^{2}+8 m}\right)^{m} \exp \left(\frac{k}{8} \sqrt{k^{2}+8 m}-\frac{k^{2}+8 m}{16}\right)
$$

The Stirling formula $m!\approx \sqrt{m} m^{m} e^{-m}$ allows us to rewrite the asymptotics of $C_{m}$ :

$$
C_{m} \approx \frac{1}{\sqrt{m} m^{m}}\left(\frac{k^{2}}{4}+\frac{k}{4} \sqrt{k^{2}+8 m}\right)^{m} \exp \left(\frac{k}{8} \sqrt{k^{2}+8 m}+\frac{m}{2}\right)
$$

Since

$$
\lim _{m \rightarrow \infty}\left(\sqrt{k^{2}+8 m}-\sqrt{8 m}\right)=0
$$

we can furthermore replace $\sqrt{k^{2}+8 m}$ by $2 \sqrt{2 m}$ :

$$
C_{m} \approx \frac{1}{\sqrt{m} m^{m}}\left(\frac{k^{2}}{4}+\frac{k}{4} \sqrt{k^{2}+8 m}\right)^{m} \exp \left(\frac{k}{4} \sqrt{2 m}+\frac{m}{2}\right)=: e^{C_{m}^{*}}
$$

with

$$
C_{m}^{*}=m \ln \left(\frac{k^{2}}{4}+\frac{k}{4} \sqrt{k^{2}+8 m}\right)+\frac{k}{2 \sqrt{2}} \sqrt{m}+\frac{m}{2}-m \ln (m)-\frac{1}{2} \ln (m) .
$$

In case $m$ is sufficiently large with respect to $k$, we can estimate $\ln \left(k^{2} / 4+k / 4 \cdot \sqrt{k^{2}+8 m}\right)$ by $\frac{1}{2} \ln (m)+\alpha$ for some constant $\alpha$ :

$$
\begin{aligned}
C_{m}^{*} & \lesssim \frac{m}{2} \ln (m)+\alpha m+\frac{k}{2 \sqrt{2}} \sqrt{m}+\frac{m}{2}-m \ln (m)-\frac{1}{2} \ln (m) \\
& \leq-\frac{m}{2} \ln (m)+(\alpha+1 / 2) m+\frac{k}{2 \sqrt{2}} \sqrt{m} \\
& \leq-\frac{m}{2} \ln (m)+\left(\alpha+1 / 2+\frac{k}{2 \sqrt{2}}\right) m \\
& =m\left(\alpha+1 / 2+\frac{k}{2 \sqrt{2}}-\frac{1}{2} \ln (m)\right)
\end{aligned}
$$

Finally, $C_{m}=\exp \left(C_{m}^{*}\right)$ converges to zero.
Proposition 2. Denote by $\mathcal{P}\left(\mathbf{R}^{n}\right)$ the ring of all polynomials on $\mathbf{R}^{n}$. Then the linear space $\Sigma_{\infty}:=\mathcal{P}\left(\mathbf{R}^{n}\right) \cdot e^{-r^{2}}$ is dense in the space $\mathcal{C}_{\infty}^{0}\left(S^{n}\right)$ of all continuous functions on $S^{n}=\mathbf{R}^{n} \cup\{\infty\}$ vanishing at infinity.

Proof. Suppose the closure $\overline{\Sigma_{\infty}}$ of the linear space $\Sigma_{\infty}$ does not coincide with $\mathcal{C}_{\infty}^{0}\left(S^{n}\right)$. Then the Hahn-Banach Theorem implies the existence of a linear continuous functional $L: \mathcal{C}^{0}\left(S^{n}\right) \rightarrow \mathbf{R}$ such that

1. $\left.L\right|_{\Sigma_{\infty}}=0$;
2. $L\left(g_{0}\right) \neq 0$ for at least one $g_{0} \in \mathcal{C}_{\infty}^{0}\left(S^{n}\right)$.

According to Riesz' Theorem (see [Rud, Ch.6, p. 129 ff.$]$ ), $L$ may be represented by two regular Borel measures $\mu_{+}, \mu_{-}$on $S^{n}$ :

$$
L(f)=\int_{S^{n}} f(x) \mathrm{d} \mu_{+}(x)-\int_{S^{n}} f(x) \mathrm{d} \mu_{-}(x)
$$

In particular, $\mu_{+}$and $\mu_{-}$are finite. The first property $\left.L\right|_{\Sigma_{\infty}}=0$ of $L$ implies

$$
\int_{S^{n}} e^{-r^{2}} p(x) \mathrm{d} \mu_{+}(x)=\int_{S^{n}} e^{-r^{2}} p(x) \mathrm{d} \mu_{-}(x)
$$

for any polynomial $p(x)$. Let us introduce the measures $\nu_{ \pm}=e^{-r^{2}} \mu_{ \pm}$on the subset $\mathbf{R}^{n} \subset S^{n}$. Then

$$
\int_{\mathbf{R}^{n}} p(x) \mathrm{d} \nu_{+}(x)=\int_{\mathbf{R}^{n}} p(x) \mathrm{d} \nu_{-}(x)
$$

holds and remains true for any complex-valued polynomial. We may thus choose $p(x)=p_{m}(x)$ as in the previous lemma

$$
p_{m}(x)=\sum_{\alpha=0}^{m-1} i^{\alpha}\langle k, x\rangle^{\alpha} / \alpha!
$$

But, then

$$
\int_{S^{n}} p_{m}(x) e^{-r^{2}} \mathrm{~d} \mu_{+}(x)=\int_{\mathbf{R}^{n}} p_{m}(x) \mathrm{d} \nu_{+}(x)=\int_{\mathbf{R}^{n}} p_{m}(x) \mathrm{d} \nu_{-}(x)=\int_{S^{n}} p_{m}(x) e^{-r^{2}} \mathrm{~d} \mu_{-}(x)
$$

together with the uniform convergence of $p_{m}(x) e^{-r^{2}}$ to $e^{i\langle k, x\rangle} e^{-r^{2}}$ implies

$$
\int_{S^{n}} e^{i\langle k, x\rangle} e^{-r^{2}} \mathrm{~d} \mu_{+}(x)=\int_{S^{n}} e^{i\langle k, x\rangle} e^{-r^{2}} \mathrm{~d} \mu_{-}(x)
$$

i.e.,

$$
\int_{\mathbf{R}^{n}} e^{i\langle k, x\rangle} \mathrm{d} \nu_{+}(x)=\int_{\mathbf{R}^{n}} e^{i\langle k, x\rangle} \mathrm{d} \nu_{-}(x)
$$

Therefore, the Fourier transforms of the measures $\nu_{+}$and $\nu_{-}$coincide. Consequently, by Bochner's Theorem (see [Mau, Ch.XIX, p. 774 ff .]) we conclude that $\nu_{+}=\nu_{-}$on $\mathbf{R}^{n}$. The linear functional $L: \mathcal{C}^{0}\left(S^{n}\right) \rightarrow \mathbf{R}$ must thus be the evaluation of a function at infinity:

$$
L(f)=c \cdot f(\infty)
$$

a contradiction to the existence of a function $g_{0} \in \mathcal{C}_{\infty}^{0}\left(S^{n}\right)$ satisfying $L\left(g_{0}\right) \neq 0$.

## 4. The main result

Theorem 1. Let the closed subset $M \subset \mathbf{R}^{n}$ be a smooth submanifold satisfying the polynomial volume growth condition. Then the ring $\mathbf{R}[M]$ of all polynomials on $M$ is a dense subspace of the Hilbert space $L^{2}\left(M, e^{-r^{2}} \mathrm{~d} \mu\right)$.

Proof. Consider the one-point-compactification $\hat{M} \subset S^{n}$ of $M \subset \mathbf{R}^{n}$. Then Proposition 2 of Section 3 implies that

$$
\Sigma_{\infty}(\hat{M}):=\mathbf{R}[M] \cdot e^{-r^{2} / 4}
$$

is dense in $\mathcal{C}_{\infty}^{0}(\hat{M})$. We introduce the measure $\mathrm{d} \nu=e^{-r^{2} / 2} \mathrm{~d} \mu$, where $\mathrm{d} \mu$ is the volume form of $M$. Since

$$
\int_{M} \mathrm{~d} \nu=\int_{M} e^{-r^{2} / 2} \mathrm{~d} \mu=\int_{M}\left(e^{r^{2} / 4}\right)^{2} e^{-r^{2}} \mathrm{~d} \mu=: V<\infty
$$

$\mathrm{d} \nu$ defines a regular Borel measure $\mathrm{d} \hat{\nu}$ on $\hat{M}$ (by setting $\mathrm{d} \hat{\nu}(\infty)=0$ ). Therefore, the algebra $\mathcal{C}_{\infty}^{0}(\hat{M})$ of all continuous functions on $\hat{M}$ vanishing at infinity is dense in $L^{2}(\hat{M}, \mathrm{~d} \hat{\nu})$ :

$$
\overline{\mathcal{C}_{\infty}^{0}(\hat{M})}=L^{2}(\hat{M}, \mathrm{~d} \hat{\nu}) .
$$

For any function $f$ in $L^{2}\left(M, e^{-r^{2}} \mathrm{~d} \mu\right)$ we have

$$
\int_{M}\left|f e^{-r^{2} / 4}\right|^{2} e^{-r^{2} / 2} \mathrm{~d} \mu=\int_{M}|f|^{2} e^{-r^{2}} \mathrm{~d} \mu<\infty
$$

and, therefore, $f e^{-r^{2} / 4}$ lies in $L^{2}(\hat{M}, \mathrm{~d} \hat{\nu})$. Thus, for a fixed $\varepsilon>0$, there exists a function $g \in \mathcal{C}_{\infty}^{0}(\hat{M})$ such that

$$
\int_{M}\left|f e^{-r^{2} / 4}-g(x)\right|^{2} e^{-r^{2} / 2} \mathrm{~d} \mu<\varepsilon / 2
$$

According to Proposition 2 we can find a polynomial $p(x) \in \mathbf{R}[M]$ approximating $g$ :

$$
\sup _{x \in \hat{M}}\left|g(x)-p(x) e^{-r^{2} / 4}\right|^{2}<\varepsilon / 2 V
$$

Using the inequality $\|x+y\|^{2} \leq 2\|x\|^{2}+2\|y\|^{2}$ we conclude

$$
\int_{M}\left|f(x) e^{-r^{2} / 4}-p(x) e^{-r^{2} / 4}\right|^{2} e^{-r^{2} / 2} \mathrm{~d} \mu<\varepsilon
$$

but this is equivalent to

$$
\int_{M}|f(x)-p(x)|^{2} e^{-r^{2}} \mathrm{~d} \mu<\varepsilon
$$

## 5. Examples and final Remarks

We shall give a few simple examples. Notice that we recover, of course, that the polynomials are dense in $L^{2}\left(\mathbf{R}^{n}, e^{-r^{2}} \mathrm{~d} \mu\right)$ (Hermite polynomials) or in $L^{2}(M, \mathrm{~d} \mu)$ for any compact submanifold (Legendre polynomials in case $M=[-1,1]$ ).
Example 1. Consider a revolution surface in $\mathbf{R}^{3}$ defined by two polynomials $f, h$

$$
\left\{\begin{array}{l}
x=f\left(u_{1}\right) \cos u_{2} \\
y=f\left(u_{1}\right) \sin u_{2} \quad, \quad f\left(u_{1}\right)>0, \quad\left(u_{1}, u_{2}\right) \in \mathbf{R} \times[0,2 \pi] . \\
z=h\left(u_{1}\right)
\end{array}\right.
$$

Then we have $\mathrm{d} \mu=f \sqrt{f^{\prime 2}+{h^{\prime}}^{2}} \mathrm{~d} u_{1} \mathrm{~d} u_{2}$ and $r^{2}=f^{2}+h^{2}$, and thus obtain

$$
\mathbf{R}\left[f \cos u_{2}, f \sin u_{2}, h\right] \text { is dense in } L^{2}\left(\mathbf{R} \times[0,2 \pi], e^{-\left(f^{2}+h^{2}\right)} f \sqrt{f^{\prime 2}+h^{\prime 2}} \mathrm{~d} u_{1} \mathrm{~d} u_{2}\right)
$$

In the special case of a cylinder, i.e. $f=1, h=u_{1}$, this reduces to the well known fact that the ring

$$
\mathbf{R}\left[u_{1}, \cos u_{2}, \sin u_{2},\right]=\mathbf{R}\left[u_{1}\right] \otimes \mathbf{R}\left[\cos u_{2}, \sin u_{2}\right]
$$

is indeed dense in the Hilbert space

$$
L^{2}\left(\mathbf{R} \times[0,2 \pi], e^{-u_{1}^{2}} \mathrm{~d} u_{1} \mathrm{~d} u_{2}\right)=L^{2}\left(\mathbf{R}, e^{-u_{1}^{2}} \mathrm{~d} u_{1}\right) \otimes L^{2}\left([0,2 \pi], \mathrm{d} u_{2}\right)
$$

Example 2. Let $F: \mathbf{C} \rightarrow \mathbf{C}$ be a polynomial and consider the surface defined by

$$
f: \mathbf{C} \longrightarrow \mathbf{R}^{3}, \quad f(z)=(x, y,|F(z)|), \quad z=x+i y
$$

Then one checks that $\mathrm{d} \mu=\sqrt{1+\left|F^{\prime}\right|^{2}}|\mathrm{~d} z|^{2}$ and $r^{2}=|z|^{2}+|F(z)|^{2}$. Thus the following holds:

$$
\overline{\mathbf{R}[x, y,|F(z)|]}=L^{2}\left(\mathbf{R}^{2}, e^{-\left(|z|^{2}+|F(z)|^{2}\right)} \sqrt{1+\left|F^{\prime}\right|^{2}}|\mathrm{~d} z|^{2}\right)
$$

Let us study the polynomial $F=z^{2 k}$ in more detail. Here the coordinate ring coincides with the usual polynomial ring $\mathbf{R}[x, y]$ in two variables, and thus we have proved that these are dense in

$$
L^{2}\left(\mathbf{R}^{2}, e^{-\left(|z|^{2}+|z|^{4 k}\right)} \sqrt{1+4 k^{2}|z|^{2(2 k-1)}}|\mathrm{d} z|^{2}\right)
$$

Example 3. We finish with a one-dimensional example: the graph $M=\{(x, f(x)\}$ of a polynomial $f: \mathbf{R} \rightarrow \mathbf{R}^{n}$. Then $\mathrm{d} \mu=\sqrt{1+\left\|f^{\prime}\right\|^{2}} \mathrm{~d} x$, and we obtain

$$
\overline{\mathbf{R}[x]}=L^{2}\left(\mathbf{R}, e^{-\left(x^{2}+\|f(x)\|^{2}\right)} \sqrt{1+\left\|f^{\prime}\right\|^{2}} \mathrm{~d} x\right)
$$

Remark. The main result raises an interesting analogous problem in complex analysis which, to our knowledge, is still open. It is well known that the polynomials on $\mathbf{C}^{n}$ are dense in the Fock- or Bergman space

$$
\mathcal{F}\left(\mathbf{C}^{n}\right):=\left\{f \in L^{2}\left(\mathbf{C}^{n}, e^{-r^{2}} \mathrm{~d} \mu\right) \mid f \text { holomorphic }\right\}
$$

Furthermore, a theorem by Stoll (see [Sto1], [Sto2]) states that from all complex analytic submanifolds $N$ of $\mathbf{C}^{n}$, those with polynomial growth are exactly the algebraic ones, and thus the only ones for which the elements of the coordinate ring are square-integrable with respect to the Gaussian measure. It is then common to study the space

$$
\mathcal{F}(N):=\left\{f \in L^{2}\left(N, e^{-r^{2}} \mathrm{~d} \mu\right) \mid f \text { holomorphic }\right\}
$$

but we were not able to find any results on whether $\mathbf{C}[N]$ is dense herein.
More elaborate applications of the main result to the situation where $M$ carries a reductive algebraic group action will be discussed by the authors in some forthcoming works (see e.g. [Agr]). In this case, one can decompose the ring $\mathbf{R}[M]$ into isotypic components and, via Theorem 1, one obtains a decomposition of $L^{2}\left(M, e^{-r^{2}} \mathrm{~d} \mu\right)$ analogous to the classical Frobenius reciprocity.
